

Benjamin Workman was a pseudonym for the Philadelphian printer and publisher John M'Culloch. His *Elements of geography* was a popular textbook running to sixteen editions. The earlier ones measured only 135 x 85 mm. but later ones were larger at 150 x 110 mm. The first and second editions contained only a map of the world, a miniature chart of the solar system (below) and a larger folding map of the U.S.A.

From the third edition onwards there were eight maps including seven miniatures:

*The World; The Solar system; North America; South America; Europe; Asia; Africa.*

Six maps were about 105 x 65 mm. and copied from those of Richard Turner (see 1780). The chart of the solar system was a similar size but copied from a plate in another work by Turner, issued from 1783 onwards: *An Easy introduction to the arts and sciences*.
